

SAP Fiori Mobile (v2.1.x)

Introduction

What are hybrid mobile apps?

Hybrid mobile apps are web applications wrapped up their own browser which can run on any of the mobile platforms (Android, iOS, Windows etc.). The big advantage of a hybrid app is that it has a single code base, whereas a native app must be re-written for each platform.

Apache [Cordova](#) is an open-source framework for developing hybrid apps. To use native features (beyond those already available via html5,) apps can make use of plugins. These plugins handle the platform-specific code and are available for single or multiple platforms. Plugins are available to access the GPS, accelerometer or camera, for example.

SAP have written their own plugins, branded as [Kapsel](#), to handle things like logon and offline OData. These bring an enterprise flavour to hybrid apps.

What is Fiori Mobile?

Until recently SAP's recommended approach was to use the Hybrid Application Toolkit (or HAT) in order to build hybrid apps. The app build took place on the developer's PC or Mac. The HAT gained a reputation for being tricky to set up and that hindered the use of hybrid apps within the SAP ecosystem.

Fiori Mobile has at its core a cloud-build service, so there is no need to install the HAT. We can trigger the build from Web IDE. We specify the (already deployed) Fiori app(s) that we want to package and after a few minutes we can download the .apk (for Android) and .ipa (for iOS) files ready to be installed on mobile devices.

Does it work?

The cloud build service works well. It typically build for both platforms in about 8 minutes without issues. There have only been a couple of occasions when builds failed due to technical problems.

There are some facets to the technology which don't feel mature yet. One area is the offline OData features. When using Fiori Mobile things work differently to the more conventional hybrid and native apps. One example would be the destinations, because Fiori Mobile apps use a generated destination which reference the SAP Cloud Platform (CP) portal service.

My point is not that offline OData seems immature, rather that the offline features can be tricky when used with Fiori Mobile apps. We are still receiving assistance from SAP to get the offline features of our app optimised. This is a shame, because shared data and the handling of delta requests, for example, are two features which justify the 'middleware' approach to offline that SAP have taken.

Authentication has also been a challenge. On a previous project I used the [Fiori Client](#) in conjunction with SAP Cloud Identity (now officially [SAP Cloud Platform Identity Authentication](#)). The Fiori Client stored the username and password on the device so that the user didn't need to enter them every time their session timed out. We haven't achieved that yet with our Fiori Mobile app.

Account and Services

If you have production account browse on [HCP Cockpit](#) and log in. If you use trial account log in [here](#)

As we said before there is two ways to build SAP Fiori mobile application:

1. Using **Fiori Mobile Service**. Note that this service have been discontinued from March 31, 2018. Strategic features available in the mobile service for SAP Fiori have been incorporated into SAP Cloud Platform mobile service for development and operations. However you can use this service if you have old account that already has enabled that service. Using this service require two other services to be enabled: **Portal Service** and **SAP Web IDE Full-Stack Service**.

SAP Cloud Platform Cockpit

- Overview

- Services**
- Solutions
- SAP HANA / SAP ASE >
- Connectivity >
- Security >
- Repositories >
- Usage Analytics
- Members
- Platform Roles

Internet of Things

- Remote Data Sync**
Enabled
Synchronize data between remote databases and a cloud SAP HANA database.

Mobile

- Mobile Services, preview**
Enabled
Run integration and regression tests and explore new mobile features. NOT FOR PRODUCTIVE USE.

Runtimes & Containers

- HTML5 Applications**
Enabled
Develop and run HTML5 applications in a cloud environment.

User Experience

- Portal**
Enabled
Create role based, multi-channel sites to access business apps and content.

Remote Data Sync
Enabled
Synchronize data between remote databases and a cloud SAP HANA database.

Mobile

- Mobile Services, preview**
Enabled
Run integration and regression tests and explore new mobile features. NOT FOR PRODUCTIVE USE.
- SAP Fiori Mobile**
Enabled
Optimize, build, manage, and monitor SAP Fiori apps on mobile devices.

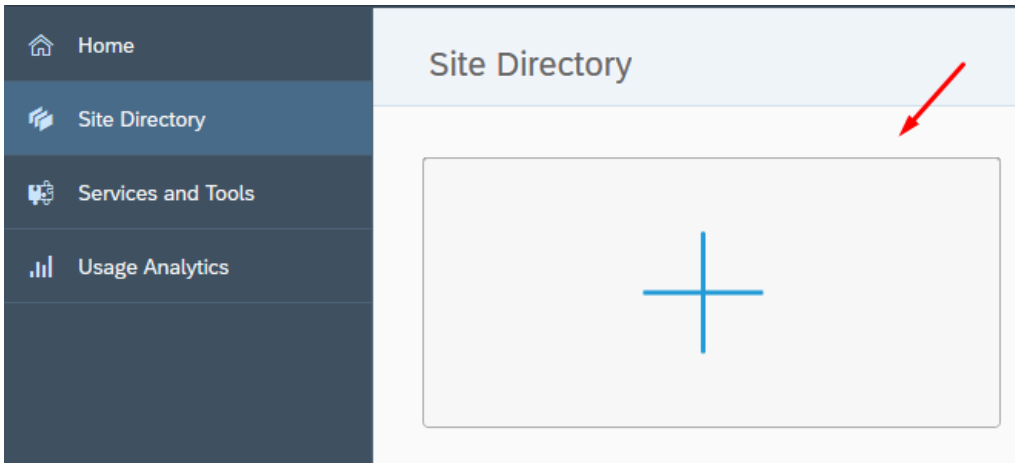

2. Using **HAT** (Hybrid Application Toolkit) extension in **SAP Web IDE Full-Stack Service**. Using this extension require **Mobile Services** to be enabled.

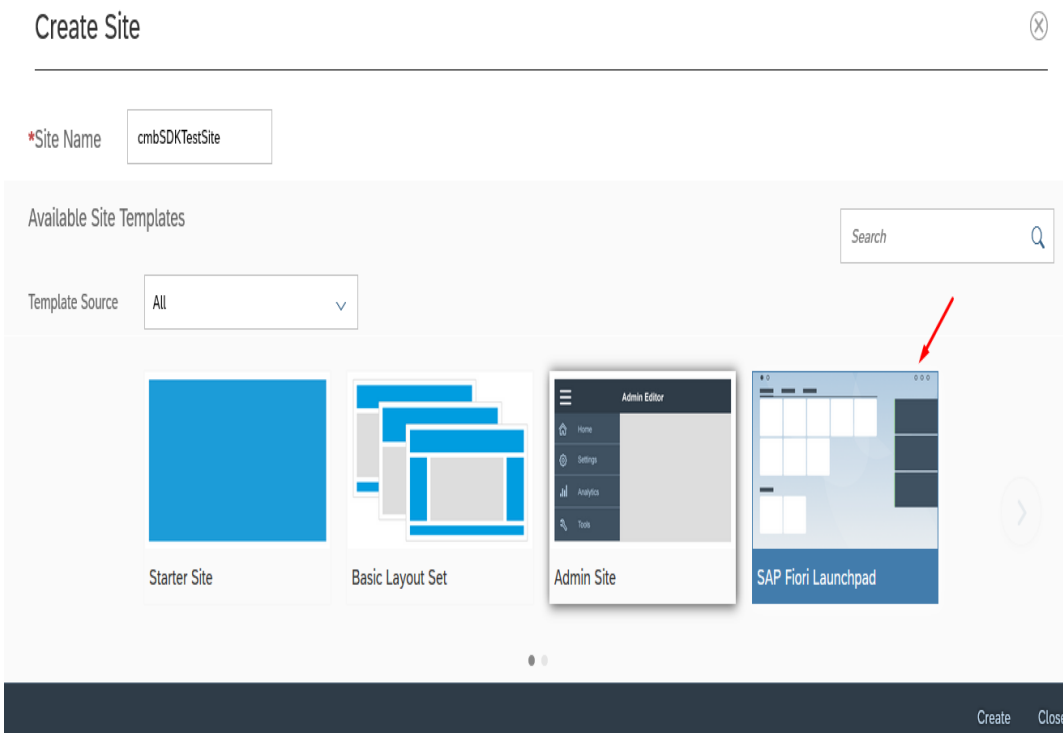

Create Fiori Launchpad

If we use SAP Fiori Mobile Service to build mobile application first we need to create and publish site where application will be deployed. Otherwise if we use HAT skip this step and continue with Create Fiori Project

Go to **Portal Service** and create new Site Directory

A popup will be displayed. Enter your **Site Name**, choose **SAP Fiori Launchpad** as Template Source and click Create

Following this you will be redirected to SAP Fiori Configuration Cockpit. Close the tab and go back to Admin Space for Portal Service.

Now we need to Publish this Site and Set as default.

Create Fiori Project

Once we create and publish cmbSDKTestSite we can create our Fiori project (if we use Fiori Mobile Service to build mobile application, otherwise if we use HAT we don't need to publish site on Launchpad and creating Fiori project will be our first step).

Go to Services tab again, open SAP Web IDE Full-Stack service, and click on Go to Service

Service: SAP Web IDE Full-Stack - Overview

Enabled

Service Description

With SAP Cloud Platform Web IDE Full-Stack, you can easily develop, test, and upgrade apps for business users. Create applications rapidly and deliver an outside world or build SAP Fiori apps, create new SaaS solutions, extend SAP S/4HANA cloud, and build IoT apps for SAP Leonardo, using the UI development toolkit for HTML5, the SAP HANA toolset, and Java programming language and technologies. Integrate with SAP Cloud Platform, such as SAP Fiori Cloud apps, Git integration, mobile services, IoT services, and more.

Take Action

[Configure Service](#)

[Logs](#)

[Go to Service](#)

A new tab will be opened. From here we will start to create our Fiori project.

- Click on New Project from Template

How to use cmbSDK cordova plugin

In the SAP Web IDE Workspace we can see all files that our Fiori project includes.

Open *Component.js* file.

Component.js is the first point of our application, we can say that it serves as index which encapsulates all our applications details, i.e. view names, routing details, main view, applications type(Full Screen or SplitApp), application service configuration etc..

Here in **init** function we will configure our plugin. Set properties that we need, set callback functions, call some methods, etc..

```
sap.ui.define([
    "sap/ui/core/UIComponent",
    "sap/ui/Device",
    "MyFirstFioriApp/MyFirstFioriApp/model/models"
], function (UIComponent, Device, models) {
    "use strict";

    var oEventBus = sap.ui.getCore().getEventBus();
    var scannerIsInitialized = false;

    return UIComponent.extend("MyFirstFioriApp.MyFirstFioriApp.Component", {

        metadata: {
            manifest: "json"
        },
    },
```

```

/**
 * The component is initialized by UI5 automatically during the startup of the app and calls the init method
 * @public
 * @override
 */
init: function () {
    // call the base component's init function
    UIComponent.prototype.init.apply(this, arguments);

    // enable routing
    this.getRouter().initialize();

    // set the device model
    this.setModel(models.createDeviceModel(), "device");

    if (!scannerIsInitialized) {

        scannerIsInitialized = true;
        window.readerConnected = 0;
        window.scannerActive = false;

        cmbScanner.addOnResume(function (result) {
            cmbScanner.setAvailabilityCallback((readerAvailability) => {
                if (readerAvailability === cmbScanner.CONSTANTS.AVAILABILITY_AVAILABLE) {
                    oEventBus.publish("ScanView", "SetConnectionStatus", {
                        statusText: "AVAILABLE"
                    });
                }
                cmbScanner.connect((result) => {});
            } else {
                oEventBus.publish("ScanView", "SetConnectionStatus", {
                    statusText: "NOT AVAILABLE"
                });
            }
        });
        if (Device.os.android) {
            cmbScanner.connect((result) => {});
        }
    });

    cmbScanner.addOnPause(function (result) {
        if (Device.os.android) {
            cmbScanner.disconnect();
        }
        cmbScanner.setAvailabilityCallback();
    });

    cmbScanner.setPreviewContainerPositionAndSize(0, 0, 100, 50);

    cmbScanner.setConnectionStateDidChangeOfReaderCallback((connectionState) => {
        if (connectionState === cmbScanner.CONSTANTS.CONNECTION_STATE_CONNECTED) {
            oEventBus.publish("ScanView", "SetConnectionStatus", {
                statusText: "CONNECTED"
            });
        }
        if (window.readerConnected !== connectionState) {
            cmbScanner.setSymbologyEnabled("SYMBOL.DATAMATRIX", true);
            cmbScanner.setSymbologyEnabled("SYMBOL.C128", true);
            cmbScanner.sendCommand("SET TRIGGER.TYPE 2");
        }
    } else if (connectionState === cmbScanner.CONSTANTS.CONNECTION_STATE_DISCONNECTED) {
        oEventBus.publish("ScanView", "SetConnectionStatus", {
            statusText: "DISCONNECTED"
        });
    } else if (connectionState === cmbScanner.CONSTANTS.CONNECTION_STATE_CONNECTING) {
        oEventBus.publish("ScanView", "SetConnectionStatus", {
            statusText: "CONNECTING"
        });
    } else if (connectionState === cmbScanner.CONSTANTS.CONNECTION_STATE_DISCONNECTING) {
        oEventBus.publish("ScanView", "SetConnectionStatus", {
            statusText: "DISCONNECTING"
        });
    }
    window.readerConnected = connectionState;
    });

    cmbScanner.setAvailabilityCallback((readerAvailability) => {
        if (readerAvailability === cmbScanner.CONSTANTS.AVAILABILITY_AVAILABLE) {
            oEventBus.publish("ScanView", "SetConnectionStatus", {
                statusText: "AVAILABLE"
            });
        }
    });
}

```

```

        });
        cmbScanner.connect((result) => {});
    } else {
        oEventBus.publish("ScanView", "SetConnectionStatus", {
            statusText: "NOT AVAILABLE"
        });
    }
});

cmbScanner.setActiveStartScanningCallback((result) => {
    if (result === true)
        window.scannerActive = true;
    else
        window.scannerActive = false;
});

cmbScanner.setPreviewOptions(cmbScanner.CONSTANTS.PREVIEW_OPTIONS.DEFAULTS | cmbScanner.COMMON_OPTIONS);

cmbScanner.setCameraMode(cmbScanner.CONSTANTS.CAMERA_MODES.NO_AIMER);

var sdkKEY = "";
if (Device.os.android)
    sdkKEY = this.getModel("i18n").getProperty("MX_MOBILE_LICENSE_ANDROID");
else
    sdkKEY = this.getModel("i18n").getProperty("MX_MOBILE_LICENSE_IOS");

cmbScanner.registerSDK(sdkKEY);

cmbScanner.loadScanner(0, (result) => {
    cmbScanner.connect((result) => {});
});

oEventBus.subscribe("Component", "LoadScanner", this.loadScanner, this);
}
},
loadScanner: function (sChanel, sEvent, oData) {
    cmbScanner.disconnect((result) => {
        cmbScanner.loadScanner(oData.selectedDevice, (result) => {
            cmbScanner.connect((result) => {});
        });
    });
},
onExit: function () {
    oEventBus.unsubscribe("Component", "LoadScanner", this.loadScanner, this);
    cmbScanner.disconnect();
    cmbScanner.setAvailabilityCallback();
}
});
});

```

cmbScanner is an object that represents our plugin. With this object we can access all [API methods](#) and Constants from our plugin.

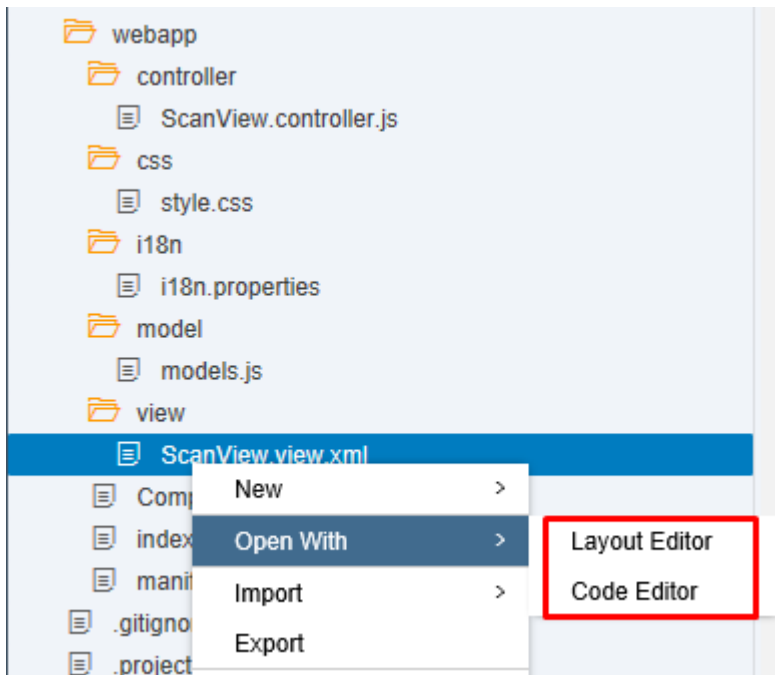

- **scannerIsInitialized** - variable to make sure that we set some functions for initialization only one time
- **window.readerConnected** - global variable that is changed every time when the reader connection state is changed
- **window.scannerActive** - global variable that shows us if scanning is active or not
- **cmbScanner.addOnPause** - in this method we disconnection from reader device on Android (on iOS this is handled automatically), and stop listening to availability changing
- **cmbScanner.addOnResume** - in this method we try to connect with reader device again and set callback for availability changing
- **cmbScanner.setPreviewContainerPositionAndSize** - to set the size and position of the preview container. Learn more [here](#).
- **cmbScanner.setConnectionStateDidChangeOfReaderCallback** - all **connect/disconnect** events should be handled within the callback function set with this API method. If connection state is **connected** we set some reader device settings with [API methods](#) or directly with [sendCommand\(\)](#) method. Here in this example we enable symbologies and set trigger type. Also here we should Licensing the SDK. We will speak about this later in this section
- **cmbScanner.setAvailabilityCallback** - to monitor for availability of the MX device. If MX device is available we try to connect. Learn more [here](#).
- **cmbScanner.setActiveStartScanningCallback** - to monitor the state of the scanner. Learn more [here](#).
- **cmbScanner.loadScanner** - to get a scanner up and running. Learn more [here](#).

Here we are only configuring reader device, handling connections, availability, etc.. We will do scanning and getting results in other views. If we want to notify users about every connection state changed or other info about reader device we will be using [EventBus](#) sap object. With this object we can publish function and call them from any view in the application. In this example on connection state changed with EventBus we are calling **SetConnectionStatus** function that is implemented in view where scanning is performed and set label text to show user current connection state.

Now open **ScanView.view.xml** and add this code:

```
<mvc:View controllerName="MyFirstFioriApp.MyFirstFioriApp.controller.ScanView" xmlns:mvc="sap.ui.core.mvc" displayBlock="true"
xmlns:core="sap.ui.core">
  <Shell id="shell">
    <App id="app">
      <pages>
        <Page id="page" title="{i18n>title}">
          <subHeader>
            <Toolbar id="__toolbar2" width="100%">
              <content>
                <FlexBox id="__box0" width="100%" alignContent="Center" alignItems="center">
                  <items>
                    <Select id="selectActiveDevice" items="{/DeviceList}"
                    <core:Item text="{text}" key="{key}">
                    </Select>
                  </items>
                </FlexBox>
                <Label id="lblStatus" text="DISCONNECTED" width="100%" text="DISCONNECTED" />
              </content>
            </Toolbar>
          </subHeader>
          <content>
            <FlexBox id="flexBoxContainer" width="100%" alignContent="Start" alignItems="center">
            </FlexBox>
          </content>
          <footer>
            <Toolbar id="__toolbar1" width="100%">
              <content>
                <Button id="btnScan" press="btnScanPress" text="Scan" width="100%" />
              </content>
            </Toolbar>
          </footer>
        </Page>
      </pages>
    </App>
  </Shell>
</mvc:View>
```

You can design view with CodeEditor or with LayoutEditor.

After that open **ScanView.controller.js** and add this code

```

sap.ui.define([
    "sap/ui/core/mvc/Controller"
], function (Controller) {
    "use strict";

    var oEventBus = sap.ui.getCore().getEventBus();
    var oModel = new sap.ui.model.json.JSONModel();
    oModel.setData({
        Devices: [{
            key: "0",
            text: "MX Device"
        }, {
            key: "1",
            text: "Mobile Camera"
        }]
    });

    return Controller.extend("MyFirstFioriApp.MyFirstFioriApp.controller.ScanView", {
        onInit: function () {
            this.getView().setModel(oModel);
        },

        onAfterRendering: function () {
            window.scannerActive = false;
            switch (window.readerConnected) {
                case cmbScanner.CONSTANTS.CONNECTION_STATE_CONNECTED:
                    this.getView().byId("lblStatus").setText("CONNECTED");
                    break;
                case cmbScanner.CONSTANTS.CONNECTION_STATE_DISCONNECTED:
                    this.getView().byId("lblStatus").setText("DISCONNECTED");
                    break;
                case cmbScanner.CONSTANTS.CONNECTION_STATE_CONNECTING:
                    this.getView().byId("lblStatus").setText("CONNECTING");
                    break;
                case cmbScanner.CONSTANTS.CONNECTION_STATE_DISCONNECTING:
                    this.getView().byId("lblStatus").setText("DISCONNECTING");
                    break;
                default:
                    this.getView().byId("lblStatus").setText("UNKNOWN");
                    break;
            }
            oEventBus.subscribe("ScanView", "SetConnectionStatus", this.setConnectionStatus, this);

            cmbScanner.setResultCallback((result) => {

                if(result && result.readResults && result.readResults.length > 0){

                    result.readResults.forEach((item, index) => {

                        if (item.goodRead == true) {
                            //Perform some action on barcode read
                            //example:
                            var verticalLayoutContainer = new sap.ui.layout.VerticalLayout(null, {
                                width: "100%"
                            }).addStyleClass("sapUiSmallMarginTop");
                            verticalLayoutContainer.addContent(new sap.m.Label({
                                text: item.symbologyString + ":",
                                textAlign: "Begin",
                                design: "Bold"
                            }).addStyleClass("sapUiSmallMarginBegin"));
                            verticalLayoutContainer.addContent(new sap.m.Text({
                                text: item.readString,
                                textAlign: "Begin"
                            }).addStyleClass("sapUiSmallMarginBegin"));
                            this.getView().byId("flexBoxContainer").addItem(verticalLayoutContainer);
                        }
                        else{
                            //Perform some action when no barcode is read or just leave it empty
                        }
                    });
                }
            });

            btnScanPress: function () {
                if (window.readerConnected === cmbScanner.CONSTANTS.CONNECTION_STATE_CONNECTED) {

```

```

        if (window.scannerActive === true) {
            cmbScanner.stopScanning();
        } else {
            cmbScanner.startScanning();
        }
    },
    setConnectionStatus: function (sChanel, sEvent, oData) {
        this.getView().byId("lblStatus").setText(oData.statusText);
    },
    activeDeviceChanged: function () {
        cmbScanner.disconnect((result) => {
            oEventBus.publish("Component", "LoadScanner", {
                selectedDevice: parseInt(this.getView().byId("selectActiveDevice").getSelectedKey())
            });
        });
    },
    onExit: function () {
        oEventBus.unsubscribe("ScanView", "SetConnectionStatus", this.setConnectionStatus, this);
        if (window.readerConnected === cmbScanner.CONSTANTS.CONNECTION_STATE_CONNECTED) {
            if (window.scannerActive === true) {
                cmbScanner.stopScanning();
            }
        }
        cmbScanner.setResultCallback((result) => {
            return false;
        });
    }
});
});
});

```

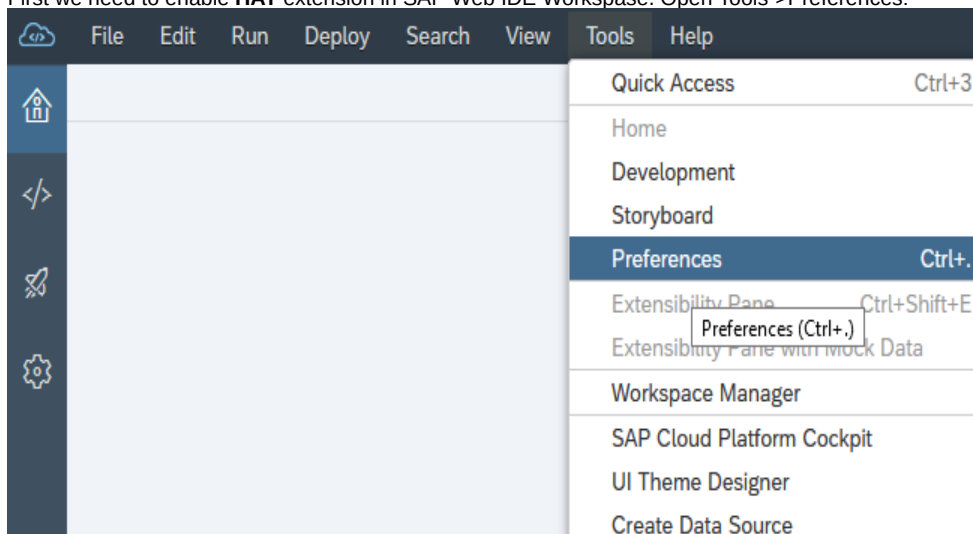

In this view we have a Scan button to [startScanning\(\)/stopScanning\(\)](#) and [cmbScanner.setResultCallback](#) to handle successful scan results.

Build Fiori Mobile Application

In this section we will explain how to build Fiori Mobile Application (generate .ipa and .apk files).

1. Using HAT (Hybrid Application Toolkit)

- First we need to enable HAT extension in SAP Web IDE Workspase. Open Tools->Preferences:

- Navigate to Extensions section and search for HAT extension:

The screenshot shows the SAP Web IDE Preferences interface. On the left, a sidebar contains 'Global Preferences' and 'Workspace Preferences'. Under 'Workspace Preferences', 'Extensions' is selected. The main area is titled 'Extensions' and contains a search bar with 'HAT' entered, and two dropdown menus for 'All Categories' and 'All States'. Below the search bar, it says '2 results'. Two extension cards are displayed: 'Workflow Editor' (V 1.51.0) and 'Hybrid App Toolkit' (V 1.32.3). The 'Hybrid App Toolkit' card has a red arrow pointing to its 'OFF' toggle switch.

By default HAT extension is disabled. Enable HAT extension and click Save. After enabling we will need to refresh SAP Web IDE.

Extensions

Enable the SAP Web IDE extensions you want, save, and refresh the browser.

This screenshot is similar to the previous one, but the 'Hybrid App Toolkit' extension's toggle switch is now in the 'ON' position, indicated by a red arrow. The 'Workflow Editor' extension remains disabled.

This screenshot shows the bottom of the preferences window, with a red arrow pointing to a blue 'Save' button.

- After enabling HAT go again in Tools->Preferences. If you have both Fiori Mobile and Mobile Services enabled you will have options to select one that will be used as Cloud Build Service. Please choose **Mobile Services** and click Save:

Global Preferences

- Code Check
- Code Editor
- Core Data Services
- Default Editors
- Git Committer
- Keyboard Shortcuts

Workspace Preferences

Cloud Build Service SAP Fiori Mobile (deprecated) Mobile Services

Enable Local Add-on Features

The Local Add-on features have reached end-of-maintenance. The feature will continue to be available for use as to the local add-on will not be accepted.

We recommend using the Cloud Build Service to continue building your hybrid apps with the latest versions of the

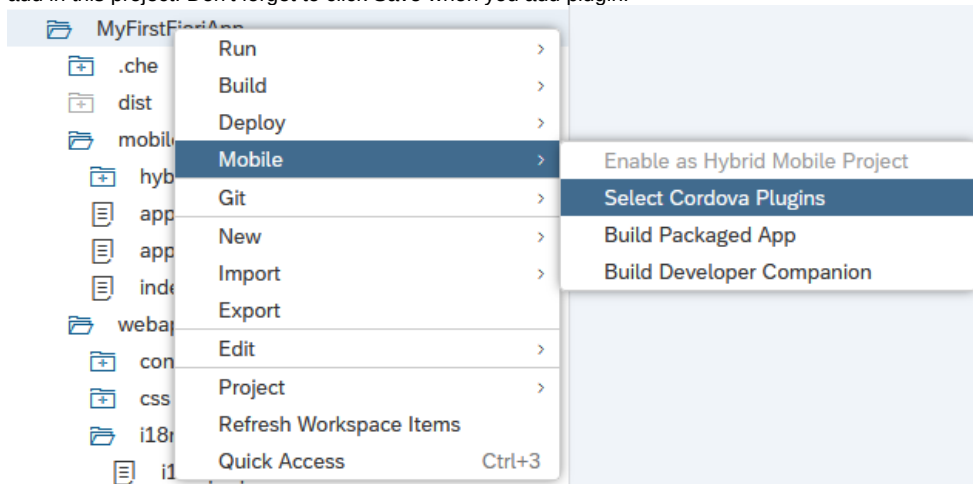

Save

If you don't see these radio buttons you don't need to do anything. **Mobile Service** will be enabled by default.

- Now right click on project root and you will see Mobile section. Click **Enable as Hybrid Mobile Project**

- You can see that some new files are added in our project that allow us to build this project as mobile application. Before build we need to add our **cmbsdk-cordova** plugin. Click on Select Cordova Plugins, find cmbsdk-cordova plugin from public plugins and add in this project. Don't forget to click Save when you add plugin.

Select Cordova Plugins

Selected (9) **Public (1)** Kapsel (20)

2. Using **Fiori Mobile Service**

Before we start to build our Fiori Mobile Application with Fiori Mobile Service we need to deploy our project on SAP HANA Cloud Platform.

- Right click on project folder then select Deploy and choose Deploy to SAP Cloud Platform

- Set application details and click Deploy

Deploy Application to SAP Cloud Platform

A build will be triggered for the project. The build results will be deployed.

Register to SAP Fiori Launchpad

Assignment

*Site	<input type="text" value="cmbSDKTestSite"/>
*Catalog	<input type="text" value="Sample Catalog"/>
*Group	<input type="text" value="Sample Group"/>

- Click finish on Confirmation tab and if everything is fine the popup below will be shown. Click OK to close this popup. With these steps we deploy our project on HCP and now we can continue to build our Fiori Mobile Application

- Go to Services tab again, open Fiori Mobile service, and click on Go to Admin Console

- Open Manage Plugins section and upload **cmbSDK-cordova** plugin as custom plugin. You can download latest plugin on this [link](#).

The screenshot shows the 'Manage Plugins' section of the application. A modal dialog titled 'Add Custom Plugin' is open, allowing the user to upload a custom plugin. The dialog includes a 'Source File' field with the text 'cmbSDK_Cordova_v2.1.3.12014.zip' and a 'Browse...' button. There is also a 'Source URL' field. A help message at the bottom of the dialog states: 'Please refer to the "Managing Custom Plugins" section in our [help guide](#) to know more about the plugin specification that is supported.' The dialog has 'OK' and 'Cancel' buttons at the bottom right.

- Next manage your signing profiles. Open Manage Signing Profiles section and create new ones if you don't have already

The screenshot displays the 'Manage Signing Profiles' section. On the left, there is a sidebar with navigation options. The main content area shows a table of profiles. The 'Platforms' column is expanded to show 'All', 'Android', and 'IOS'. There are 4 profiles listed. Each profile card shows a platform icon, a name, and details about who uploaded or generated it and when it expires.

Platform	Profile Name	Generated By	Expiry Date
iOSSapAp...	Uploaded By	[Redacted]	May 27, 2020
AndroidSa...	Generated By	[Redacted]	Jun 18, 2044
iOS	NAT_Daniel	Uploaded By	Expired On May 11, 2018
Android	NAT	Generated By	Expiry Date Oct 6, 2042

- Now open Manage Apps section and create New Application

- Select first option

[Apps home](#) / Add new application

What's Your Fiori App Scenario?

Tell us about the number of Fiori apps you want to put into a single binary

- I want to create a local launchpad with only the apps I want to mobilize.
Choose this if you want to create a custom, local launchpad with multiple Fiori applications. We'll download the UI for the apps into the binary when we build it, so it's there when the app launches. You'll need Fiori 1.30+ compliant applications and be running the Fiori Server UI Add-on 2.0.
- I want to mobilize an existing launchpad or Fiori application.
Choose this if you have a single Fiori URL you want to mobilize, or if you are not running the Fiori Server UI Add-on 2.0.

- Set you application name and signing profiles. At the bottom of page you have question "Are you ready to build the application ?". Select "No, I would like to customize my application".

Build Your Fiori Application

152px X 152px

 *Application Name

Connection Security
Users will be authenticated with SAML each time the application is used.

Build Options

iOS Signing Profile: Minimum OS Version:

Android Signing Profile: Minimum OS Version:

Enable Android and/or iOS project(s) download after build

Enable verbose logging

Build debug-enabled binaries

Note: If you would like to debug your Android application with Chrome and/or your iOS application with Safari, enable this option. For Android, your application will be automatically signed with an internal debug signing profile. For iOS, select a developer signing profile to sign your application to enable you to debug.

For iOS, an iOS signing profile must be selected to enable the build option.

Cached Content

Clear cached content prior to initiating build

Note: SAP caches the SAPUI5 runtime referenced by your application in order to reduce build time. If you believe this content may have been updated since the last time an application was built referencing this SAP Fiori front-end server, enable this option.

Multimedia

Splash Screen - Portrait Splash Screen - Landscape

1536px X 2048px 2048px X 1536px

Are you ready to build the application?

Yes

No, I would like to customize my application

- Window where we can continue with app customization will be opened. From here we will add plugin that we uploaded before and disable passcode screen. You can set some others parameters per your needs. Also important thing here is to save every change that will be made.

Connection Security

Users will be authenticated with SAML each time the application is used.

Application Passcode Policy

Disable Passcode Screen

Enforce Frot application passcode:

Minimum passcode length in characters	<input type="text" value="0"/>
Passcode expiration timeout in minutes	<input type="text" value="5"/>
Maximum retries	<input type="text" value="10"/>
Minimum unique characters	<input type="text" value="0"/>
<input type="checkbox"/> User must change passcode in days	<input type="text" value="30"/>

Allow default passcode

Passcode must contain at least one of the following character types:

- Numeric (0-9)
- Lowercase alpha (a-z)
- Uppercase alpha (A-Z)
- Special (such as #, @, *)

Application Security

Privacy Screen:

iOS and Android devices have app switchers that display screenshots of your apps. This is a possible privacy risk for apps that display sensitive information. To enhance the security of on-device data, SAP Fiori Client by default enables the Privacy Screen feature, which hides application content in the app switcher. On Android devices, the Privacy Screen plugin also prevents users from taking screenshots and sharing the screen. This feature is enabled by default.

Disable Privacy Screen

- We are ready to build our mobile application and generate .ipa and .apk files. Navigate to Platforms and click **Build All** button if you want to build both iOS and Android platform together, or you can build one by one from Actions grid column.

Apps home / cmb-SDK Sample App

Licensing the SDK

If you plan to use the **cmbSDK** to do mobile scanning with a smartphone or a tablet (without the MX mobile terminal), the SDK requires the installation of a license key. Without a license key, the SDK will still operate, although scanned results will be blurred (the SDK will randomly replace characters in the scan result with an asterisk character).

Contact your Cognex Sales Representative for information on how to obtain a license key including trial licenses which can be used for 30 days to evaluate the SDK.

After obtaining your license key open `i18n.properties` file in your project on SAP WEB IDE service, and set your obtained keys.

The screenshot shows the SAP WEB IDE interface. On the left, the Project Explorer displays the file structure for 'MyFirstFioriApp', including folders like '.che', 'dist', 'webapp', and files like 'i18n.properties'. The 'i18n.properties' file is selected and open in the main editor. The content of the file is as follows:

```

1 title=Title
2 appTitle=MyFirstFioriApp
3 appDescription=App Description
4 MX_MOBILE_LICENSE_ANDROID=Android_Key
5 MX_MOBILE_LICENSE_IOS=iOS_Key
  
```

The last two lines, which contain the license keys, are highlighted with a red rectangular box.

Then go back to the `Component.js` file and check this code:

```
...  
  
var sdkKEY = "";  
if (Device.os.android)  
    sdkKEY = this.getModel("i18n").getProperty("MX_MOBILE_LICENSE_ANDROID");  
else  
    sdkKEY = this.getModel("i18n").getProperty("MX_MOBILE_LICENSE_IOS");  
  
cmbScanner.registerSDK(sdkKEY);  
  
...
```

You can see that you read this key from `i18n.properties` and call `cmbScanner.registerSDK` method to register SDK with your license key.
